

Your goal: Spontaneous chemical engineering education

The catalyst: McGraw-Hill textbooks.

ANALYSIS OF HEAT AND MASS TRANSFER

E.R.G. ECKERT, University of Minnesota and ROBERT M. DRAKE, JR., Combustion Engineering, Inc. *McGraw-Hill Series in Mechanical Engineering*. 1972, 832 pages, \$21.50

Unlike most other books at this level which discuss only one of the three transfer mechanisms, *this one volume covers conduction, convection, and radiation.*

TRANSFER OPERATIONS

R. A. GREENKORN and D. P. KESSLER, both of Purdue University. 1972, 496 pages (tent.), \$15.50 (tent.)

Professors Greenkorn and Kessler have designed *Transfer Operations* to provide the student with a basic knowledge of the mechanisms by which momentum, heat, and mass are transferred and to introduce the student to the design and use of equations for momentum, heat, and mass.

APPLIED NONLINEAR PROGRAMMING

DAVID M. HIMMELBLAU, The University of Texas, Austin. 1971, 512 pages, \$18.50

Incorporating the results of *practical* experience, this senior/graduate level text is an excellent sourcebook for engineers working in optimization, operations research, and systems engineering.

HEAT TRANSFER, Third Edition

JACK P. HOLMAN, Southern Methodist University. 1972, 480 pages (tent.), \$12.50 (tent.)

A Solutions Manual and five cassette tapes with an accompanying student workbook will be available.

Retaining a technically correct presentation, this text offers a brief and concise treatment of *all* phases of heat transfer.

EXTENDED SURFACE HEAT TRANSFER

DONALD Q. KERN, and ALLAN D. KRAUS, University of South Florida. 1972, 704 pages (tent.), \$22.50 (tent.)

Containing a great amount of original material as well as numerous references to the literature, this text provides a complete treatment of the theories and applications of extended surfaces.

SEPARATION PROCESSES

C. JUDSON KING, University of California, Berkeley. *McGraw-Hill Series in Chemical Engineering*. 1971, 832 pages, \$19.50

Departing from the classical approach to the subject, this text treats industrial separations as a general problem, and stresses the many common aspects of the functioning and analysis of different separation processes.

THERMAL RADIATION HEAT TRANSFER

ROBERT SIEGEL, Lewis Research Center, NASA and JOHN R. HOWELL, University of Houston. 1972, 832 pages, \$18.50

Written in a straightforward and easily readable style, this undergraduate/graduate text contains a comprehensive discussion of heat transfer by thermal radiation.

ELEMENTS OF TRANSPORT PHENOMENA

LEIGHTON E. SISSOM and DONALD R. PITTS, both of Tennessee Technological University. 1972, 832 pages, \$18.50

Assuming a basic knowledge of differential equations and vector calculus, this text offers both the undergraduate and graduate student a *modern, integrated* treatment for the study of heat, mass, and momentum transfer.

MOMENTUM, ENERGY AND MASS TRANSFER IN CONTINUA

JOHN C. SLATTERY, Northwestern University. 1972, 704 pages, \$19.50

Highly-flexible, this book offers the first-year graduate student an *integrated* introduction to four subjects that are often taught separately and with their own viewpoints: fluid mechanics, thermodynamics, heat transfer, and mass transfer.
