

## **We have a growing need for chemical engineers.**

Union Camp today is 14,000 people working together for the preservation and effective utilization of 1.7 million acres of land. And we're committed to growth. Our net sales in 1968 were up about 20% over those of 1967—and we anticipate a growth of 28% in 1969, compared to 1968. And that's a lot better than the increase in gross national product, population, or practically any of the usual yardsticks for measuring corporate growth.

We're looking for talented imaginative chemical engineers to grow with us. Men who thrive on challenge. Men who will be the key to Union Camp's future success.

Opportunities for chemical engineers exist in design and development of new processes, process improvement and control and product development. Specific project areas include wood pulping, chemicals recovery, pulp treatment, paper manufacturing, environmental

control, and organic chemical production from wood by-products (the largest such operation in the forest products industry). Positions are presently available in production, technical service, sales and research and development.
