

# TAP Sampling for Asian Citrus Psyllid (ACP) Field Sheet<sup>1</sup>

Monitoring ACP populations is an important tool in the integrated management of citrus greening. The most efficient way to estimate field populations of this insect is by monitoring adults. Tap sampling has proven to provide data needed to make informed decisions for managing this insect pest. Other pest and beneficial insects and mites may fall on the sheet and can also be counted. We recommend 10 tap samples in each of the 10 locations per block, 5 on the periphery and 5 in the interior. ACP tends to accumulate on the block periphery, which therefore may require more frequent sprays.

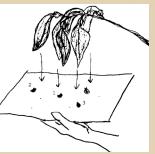

# **How to Sample**

1. Place back side of this laminated sheet 1 foot under the branch to be sampled.

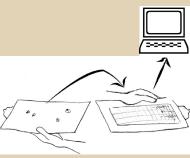

2. Tap the selected branch sharply with a PVC pipe or stick

3. Quickly count the insects (beneficials and pests) that fall onto the sheet. Pay special attention to ACP.

Trash bugs

4. Write the number of insects from each sample on a datasheet for later reference and entry onto a spreadsheet.

THERE IS NO AGREED UPON THRESHOLD FOR CONTROL OF ACP. HOWEVER. RESEARCH HAS SHOWN THAT TWO **DORMANT SPRAYS FOLLOWED** BY INSECTICIDE APPLICATIONS WHEN ADULTS REACH 10 **PER 100 TAPS IS A VIABLE** MANAGEMENT ALTERNATIVE TO MONTHLY SPRAYS FOR MATURE CITRUS TREES WITH HIGH **INCIDENCE OF HLB** 

## What to look for: Beneficials or Pests

## **BENEFICIAL**

Spiders

#### **PEST**

Citrus leafminer adult
